

e-CONSTRUCTION

FOR COUNTIES

e-Construction is the collection, review, approval, and distribution of road and highway construction project data in a paperless environment.

Upgrading Obsolete Processes for Efficiency

Yes, it's true that many counties and state departments of transportation are adopting e-construction software technology to improve the efficiency of the construction and documentation process. This technology allows for the digitization of many traditional paper-based processes and documentation, making it easier to manage and store information related to road and highway construction projects.

What is e-Construction?

e-Construction is a paperless construction administrative method for tracking and documenting road and highway construction projects by recording data online. e-construction software can be used to create and manage digital versions of field books, journals, documents, notes, spreadsheets, and other data related to a project, and by eliminating the need for paper-based documentation, it can significantly reduce the potential for errors associated with data transfer and transcription.

In addition to improving efficiency and reducing errors, e-construction software also offers other benefits. It can provide real-time access to project data for all stakeholders, including project managers, engineers, contractors, and inspectors. This can improve communication and collaboration and facilitate decision-making.

Transitioning to Electronic Project Documentation

The *integrated Project Development (iPDWeb)* solution by ExeVision is an easy-to-use software application, accessed through standard web browsers on desktop computers, laptops, or on mobile tablets. All standard documentation typically required for tracking and managing construction projects is supported, including:

- Daily Reports
- Change Orders
- Quantity Book
- Subcontracts
- Pay Estimates
- Reporting
